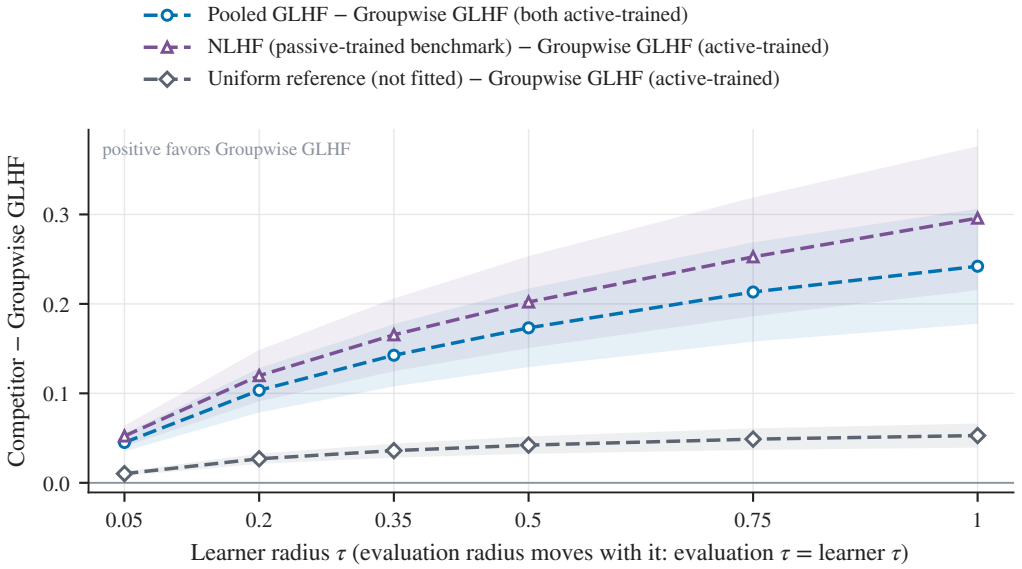
Learner-radius ablation: competitor gaps | evaluation regime: moving
moving: evaluation radius moves with the learner radius (evaluation tau = learner tau)



tau is the LEARNER radius, and in this regime the evaluation radius MOVES with it (evaluation tau = learner tau), so each point is a different estimand: this panel is a diagnostic, not the cross-radius comparison. Intervals are Nadeau-Bengio corrected repeated-CV 95% intervals (df = 99), marginal per cell. They are not simultaneous over the grid and are not respondent bootstrap intervals. NLHF is passive-trained in every condition of this study and is drawn here as the passive-trained benchmark, never as an active learner.
